

**What is claimed is:**

1. A method of debugging an application program from a workstation, wherein the application program resides on a server that is remote from the workstation, the method comprising:

5       invoking the application program from the workstation via a network interface;  
          displaying a user frame at the workstation that includes information generated by  
          the application program;  
          providing a debug view option at the workstation for generating a debug frame of  
          the application program; and  
10       displaying the debug frame at the workstation when the debug view option is  
          selected, wherein the debug frame includes information about one or more  
          components of the application program.

2. The method of Claim 1 further comprising:

15       providing a user view option at the workstation for generating the user frame; and  
          displaying the user frame when the user view option is selected.

3. The method of Claim 1 wherein displaying the debug frame at the workstation includes providing a list of variable names in the application program.

20       4. The method of Claim 3 wherein displaying the debug frame at the workstation includes providing at least one of: a list of request information variable names in the application program, or a list of session information variable names in the application program.

5. The method of Claim 3, wherein one or more of the variable names represents a corresponding object, the method further comprising:

25       selecting one of the variable names; and  
          providing information about the object corresponding to the variable name on the  
          debug frame.

6. The method of Claim 5 wherein the information about the object includes at least one of: the fields of the object, the methods associated with the object, or the constructors associated with the object.

7. A computer readable storage media comprising:  
5 computer instructions to implement the method of claim 1.

8. A signal in a carrier medium comprising:  
computer instructions to implement the method of claim 1.

9. A method of debugging an application program from a workstation, wherein  
10 the application program resides on a server that is remote from the workstation, the  
method comprising:

executing the application program on the server when the application program is  
invoked from the workstation;  
generating information for a user frame at the workstation that includes  
information generated by the application program; and  
15 generating information for a debug frame at the workstation when a debug view  
option is selected from the workstation, wherein the debug frame includes  
information about components of the application program.

10. The method of Claim 9 wherein generating information for the debug frame  
includes saving the information for the user frame when the debug view option is  
20 selected.

11. The method of Claim 10 further comprising restoring the saved information  
for the user frame when a user view option is selected at the workstation.

12. The method of Claim 9 wherein generating information for the debug frame  
includes generating a list of components of the application program.

13. The method of Claim 9 wherein generating information for the debug frame includes generating at least one of: a list of variables in the application program, a list of methods associated with one or more of the variables in the application program, or a list of constructors associated with one or more of the variables in the application program.

5        14. The method of Claim 9 wherein generating information for the debug frame includes using reflection technology to generate at least one of: a list of variables in the application program, a list of methods associated with one or more of the variables, and a list of constructors associated with one or more of the variables.

10      15. A computer readable storage media comprising:  
computer instructions to implement the method of claim 9.

16. A signal in a carrier medium comprising:  
computer instructions to implement the method of claim 9.

17. An apparatus for debugging an application program from a workstation, wherein the application program resides on a server that is remote from the workstation,  
15      the method comprising:

means for invoking the application program from the workstation;  
means for presenting a user frame at the workstation that includes information generated by the application program;  
means for presenting a debug view option at the workstation to generate a debug  
20      frame of the application program; and  
means for presenting the debug frame at the workstation when the debug view option is selected.

18. The apparatus of Claim 17 further comprising:  
means for presenting a user view option at the workstation for generating the user  
25      frame; and  
means for presenting the user frame when the user view option is selected.

Docket No M-11705 US  
Client Ref. No. T00053  
773394 v1

19. The apparatus of Claim 17 wherein the debug frame at the workstation includes presenting a list of components of the application program.

20. The apparatus of Claim 17, wherein one or more of the components represents a corresponding object, the apparatus further comprising:

5       means for selecting one of the objects; and  
          means for presenting information about the selected object, wherein the information about the object includes at least one of: the name of the object, the fields of the object, the methods associated with the object, or the constructors associated with the object.

10      21. An apparatus for debugging an application program from a workstation, wherein the application program resides on a server that is remote from the workstation, the method comprising:  
          means for executing the application program on the server when the application program is invoked from the workstation;

15      means for generating information for a user frame at the workstation that includes information generated by the application program; and  
          means for generating information for a debug frame at the workstation when a debug view option is selected from the workstation, wherein the debug frame includes information about components of the application program.

20      22. The apparatus of Claim 21 wherein the means for generating information for the debug frame includes means for saving the information for the user frame when the debug view option is selected.

23. The apparatus of Claim 22 further comprising means for restoring the saved information for the user frame when a user view option is selected at the workstation.

25      24. The apparatus of Claim 21 wherein the means for generating information for the debug frame includes means for generating a list of objects in the application program.

25. The apparatus of Claim 24 wherein the means for generating information for the debug frame includes at least one of: means for generating a list of methods associated with one or more of the objects in the application program, or means for generating a list of constructors associated with one or more of the objects in the  
5 application program.

26. The apparatus of Claim 24 wherein the means for generating information for the debug frame includes using reflection technology to generate at least one of: a list of objects in the application program, a list of methods associated with one or more of the objects, and a list of constructors associated with one or more of the objects.

10 27. The apparatus of Claim 24 further comprising:  
means for providing the list of objects to the workstation when the debug view option is selected at the workstation.

15 28. The apparatus of Claim 25 further comprising:  
means for providing at least one of: a list of names of the objects, a list of fields of at least one of the objects, a list of values of at least one of the objects, the list of methods associated with at least one of the objects, or the list of constructors associated with at least one of the objects.

20 29. A system for debugging an application program from a workstation, wherein the application program resides on a server that is remote from the workstation, the  
system comprising:

a user interface operable to:  
allow a user to invoke the application program from the workstation;  
present a user frame at the workstation that includes information generated by the application program;  
25 present a debug view option to generate a debug frame of the application program; and  
present the debug frame at the workstation when the debug view option is selected.

30. The system of Claim 29 wherein the user interface is further operable to:  
present a user view option at the workstation; and  
present the user frame when the user view option is selected.

31. The system of Claim 29 wherein the debug frame at the workstation includes  
5 a list of one or more components of the application program.

32. The system of Claim 29 wherein the application program generates  
instructions and information for displaying a web page at the user interface.

33. The system of Claim 29 wherein the user interface is a web browser operable  
to communicate with the server.

10 34. The system of Claim 31 further wherein the user interface is operable to  
present additional information about at least one of the components when the component  
is selected by the user.

15 35. The system of Claim 34, wherein the additional information includes at least  
one of: the name of the component, the fields of the component, the methods associated  
with the component, or the constructors associated with the component.

36. A system for debugging an application program from a workstation, wherein  
the application program resides on a server that is remote from the workstation, the  
system comprising:

20 means for executing the application program on the server when the application  
program is invoked from the workstation;  
means for generating information for a user frame at the workstation that includes  
information generated by the application program; and  
a debugger program operable to generate information for a debug frame at the  
workstation when a debug view option is selected from the workstation,  
25 wherein the debug frame includes information about components of the  
application program.

37. The system of Claim 36 wherein the debugger program is operable to save the information for the user frame when the debug view option is selected.

38. The system of Claim 37 wherein the debugger program is operable to restore the saved information for the user frame when a user view option is selected at the 5 workstation.

39. The system of Claim 36 wherein the debugger program is operable to generate a list of objects in the application program.

40. The system of Claim 39 wherein the debugger program is operable to generate at least one of: a list of methods associated with one or more of the objects in the 10 application program, or a list of constructors associated with one or more of the objects in the application program.

41. The system of Claim 36 wherein the debugger program is operable to use reflection technology to generate at least one of: a list of objects in the application program, a list of methods associated with one or more of the objects, and a list of 15 constructors associated with one or more of the objects.

42. The system of Claim 36 wherein the application program generates instructions and information for displaying a web page.

43. The system of Claim 36 wherein the server is operable to communicate with a web browser program at the workstation.

20 44. The system of Claim 36 wherein the application program accesses at least one of: internal code, private code, or public code.
